

Problem 7: Hashing – Extra

We aim to store in a hashing table a list of words, it means a small dictionary, and verify if a given text or paragraph has all its words written well according to this small dictionary. Your program takes as input a text file containing the list of words to add to the hashing table, and in the output you should display the words that does not correspond exactly to the words in the dictionary.

- Write a C++ program that implements a hashing table and solve the problem. What is the complexity of your program?
